

Botanical Garden

The botanical garden is one of the prominent features of our college. The botanical garden is spread across a 1.4-acre area. There is a collection of more than 350 plant species belonging to various taxonomic groups, having different categories, such as trees, shrubs, herbs, climbers, and ornamental and medicinal plants grown in the garden. This garden significantly creates interest in students and the fraternity of Botany.

Sr. No.	Type	Number
1	Tree Species	72
2	Shrubs	54
3	Climbers and Twiners	33
4	Aquatic	12
5	Ornamental Plants	104
6	Medicinal Plants	43

The botanical garden is, in fact, an exceptional acclimatization area, where exotic plant species from all regions live together in the open air, even though out of their natural environment. The unique and diversified collections of living plants provide the basis for research and modern taxonomic studies on morphology, ecology, genetics, systematic and evolution. They supply living plant resources for academic studies on cytology, embryology, anatomy, photochemistry etc. The Botany Department provides germplasm for hybridization experiments and other class practicals.
